

FINA 7397 Energy Analysis

This course focuses on the sources value creation (i.e., the process of generating superior economic performance for the firm over the long run) in the energy industries. It studies the special challenges associated with energy projects and the methods, conventional and advanced, for evaluating these opportunities. But while the focus is on the energy industry, the concepts are cutting-edge and should be in the tool-kit of all students interested in working for major corporations or as stock analysts.
